Overview

Talas-17 is a category 1 tropical cyclone that affected the north-central coast of Vietnam and Lao PDR. This cyclone originated on 14 July 2017 in the South China Sea (northwest Pacific) at a speed of about 37 km/h. On 16 June 2017, tropical cyclone Talas-17 made landfall on the Hà Tĩnh Province, Vietnam and moved a few hours later towards the Bolikhamxai Province, Lao PDR with a maximum sustainable wind speed of 93 km/h. The tropical cyclone is soon expected to dissipate on land, however heavy rains are forecasted over the next few days, which may outcome flash floods and landslides.

Based on data of the observed and predicted tropical cyclone path, wind speeds from JRC (Warning 6 issued on 16 July 2017 at 21:00 UTC), and population data from WorldPop, UNITAR-UNOSAT conducted a population exposure analysis for Vietnam and Lao PDR:

- 3, 294, 890 people are living within 90km/h wind zones, from which 3, 283, 205 are in Vietnam
- 7, 641, 353 people are living within 60km/h wind zones from which 4, 783, 863 are in Vietnam and 2, 857, 489 in Lao PDR

Also included is an estimation of the precipitation accumulation in Vietnam (GMP) from the 14 to the 16 of July 2017. In this sense, the country's average was 240 mm of precipitation in three days with some areas reaching 300 mm.

Population exposure estimates are based on cyclone track (JRC) and WorldPop data
