Heavy rainfall and unusually warm weather have caused flooding in the northeastern region of Albania since January 8, 2010. The map shows the post-event water extent as detected on January 11, 2010. The analysis was based on an ENVISAT ASAR scene. A Landsat image acquired on June 15, 2002, was used as a base map to identify the extent of the CORINE Land Cover and CORINE Landcover layer is shown as well. Streams have been digitized on the basis of the built-up area. The map data and represent only one fraction of the road network. Please note, that the flood extent in urban areas may not be detected due to radar geometry and backscatter effects.
